

Hiver SDE Intern Take-Home — AmazonHelp AI Support Agent

Project overview

An AI customer-support agent for AmazonHelp using a prepared subset of the Customer Support on Twitter dataset. It classifies customer requests, retrieves historically grounded replies, and decides whether to auto-handle or escalate.

Data

50,000 AmazonHelp customer→response pairs are included. The 198-example evaluation set is within the required 150–250 range, but its labels are deterministic seed labels and must be human-reviewed before being described as hand-labelled.

Evaluation

Run `python -m src.run_experiment --gold data/gold_set.csv` to generate the current baseline metrics. Final submission numbers should be regenerated after human review of the gold set.
